ServiceFlow | Business Insights & Recommendations

Key Finding 1: Service Resolution Delays

- Total service requests: Approximately 10,000
- Average closure time: 111.20 hours
- Median closure time: 22.13 hours
- Requests exceeding 7 days: 620 (6.25%)

Business Insight:

The average closure time is significantly higher than the median, suggesting that some requests experience unusually long resolution times.

Recommendation:

Investigate requests with long closure times, identify recurring causes of delays, and introduce escalation procedures for overdue requests.

Key Finding 2: Highest Operational Workload

Finding: Unsanitary Condition complaints account for approximately 104,000 total closure hours, the highest among all complaint types.

Business Insight: These complaints contribute significantly to the overall service resolution workload. However, total closure hours alone do not establish whether individual requests are handled inefficiently.

Recommendation: Investigate the volume, average resolution time, and recurring causes of Unsanitary Condition complaints to identify opportunities for operational improvement.

Key Finding 3: Agency Resolution Performance

Finding: DPR has the highest average closure time at approximately 1,477 hours, followed by TLC at 1,426 hours.

Business Insight: Resolution times vary significantly across agencies. Further investigation is needed to determine whether these differences are related to request types, complexity, or workload.

Recommendation: Review delayed requests within DPR and TLC, compare agency workloads, and identify opportunities to improve resolution efficiency.

Key Finding 4: Geographic Service Performance

Finding: Average closure times vary across NYC boroughs, with Staten Island and Manhattan showing higher averages than Brooklyn and the Bronx.

Business Insight: Geographic differences may indicate variations in service demand, request complexity, or operational resources.

Recommendation: Compare request volumes and complaint types across boroughs to identify potential service gaps and opportunities for improvement.

Project Conclusion

The ServiceFlow dashboard analyzes approximately 10,000 NYC service requests to evaluate resolution efficiency, operational workload, and performance differences across agencies and boroughs.

The analysis highlights prolonged resolution times, differences in agency performance, and opportunities to improve service delivery.

Recommended Next Steps:

- Monitor overdue requests using performance KPIs.
- Investigate complaint categories with high total closure hours.
- Review agency performance and request complexity.
- Establish regular performance reporting to support operational decisions.
